

Graphene K-point A'_1 branch: extended zero-smearing view

- smearing/degauss = 0 Ry
- MLIP + full EPC LR
 - - central DFPT $N \rightarrow \infty$ guide
 - fit/support envelope
 - outside current zero-smearing DFPT support
 - ★ three-grid fixed-q intercept
 - △ two-grid $d=0.007$ intercept
 - raw DFPT k192
 - raw DFPT k240
 - ◇ raw DFPT k288

Black curve outside $|d|=0.023$:
stored Wannier/full-EPC replay only;
no new DFT and no q-shape fit.

The green guide stops at the last raw
zero-smearing DFPT location. It is dotted
for $0.007 < |d| \leq 0.023$ because this
region has k192 support only.
